

## PinPals - Ayesha Faheem

PinPals is a “Find My Iphone” meets “Google Calendar”. With this app you can create “PinMeets” which are pins on a map with a location, friend of who you want to meet with, title of the PinMeet and date/time of the meet, then it saves to your calendar.

This app is built on Xcode Version 14.2 (14C18)

I know it works on the laptop's simulator if you set the simulator's location.

I know the app also runs on an iPad generation 7 with IOS minimum deployment on 15.4

On Iphone 13 with IOS 17 i get a supported files not found error

This app requires permission of location and calendar. And it'll ask permission for notifications.

Clicking on a table view cell opens Apple Maps if you have it downloaded.

Bottom left button allows you to zoom in to the location of a specific PinMeet.

Bottom middle button resets the map's location to the user's location.

Bottom right button is where you can view and create PinMeets.

### Changes

I got rid of having a status like do not disturb or available because it was not needed.

I added the function of clicking on the cells to open directions because I think it's helpful.

I added the link to the calendar because I think it is useful.
